Title: Biodesign Innovation in Image Guided Therapy Devices: Concept to Clinical Adoption

Abstract: This talk describes how MRI-guided percutaneous devices for pelvic and abdominal procedures were successfully developed, clinically deployed, and are being commercialized in direct collaboration with industry. The talk also covers a recent study on multi-section continuum robots and their potential roles to improve transbronchial lung interventions. Both devices provide new therapy and diagnostic options for patients, but also can be used as a tool for biomedical research to discover new biomarkers or new drugs for treatments.
